## FOREWORD

The Government of Ethiopia (GOE) has been working diligently over the past two decades to ensure the fertility rights of women and men by informing and making accessible safe, effective, affordable, and acceptable contraception and/or family planning (FP) methods. A considerable proportion of our people of reproductive age have benefited from the services made available at all primary healthcare delivery points and other outlets.

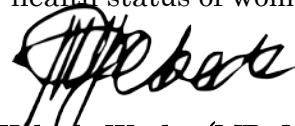

The country has come far from its previous high rates of unacceptable and untimely but avoidable deaths of mothers, newborns, and children. Family planning has been one of the strategies implemented to reduce this high maternal death rate; it has contributed immensely to this outcome by helping to avoid unwanted and unplanned pregnancies. Moreover, it also has been possible to reduce serious pregnancy-related complications and thereby affect the disability-adjusted life years of women.

A large gain has been observed in FP coverage since the early 1990s; the contraceptive prevalence rate has risen from 4 percent to 42 percent in 2014. This success in reducing a considerable percentage of unmet need for spacing of births has contributed to child survival, hence enabling women to limit their desired number of children. The average number of children a woman will have has decreased from nearly seven in the 1990s to 4.1 in 2014. Nonetheless, there are challenges we must overcome to ensure that these gains continue. Some of these challenges include addressing the disparity of success amongst the regions of the nation, dependency on short-term FP methods, identifying additional resources to meet the funding needs for family planning, and the need for contraceptive security and an efficient supply chain management system.

In line with Ethiopia's FP2020 commitments, the Health Sector Transformation Plan is aimed at scaling up informed and voluntary use of contraception to reach an additional 6.2 million women so as to reduce unmet needs and increase the contraceptive prevalence rate (CPR) to 55 percent by 2020. In addition to key strategic plan documents aimed at improving maternal health, the Ministry of Health, in collaboration with partners, has developed the Family Planning Costed Implementation Plan (CIP), 2015–2020 to harness efforts for increased access to FP information and services. The development of the CIP is recognized as a critical process for aligning the government and stakeholders around a common vision, and outlining the activities and timeline for achieving key milestones. This document reflects the strategies, goals, and objectives of the GOE and its many partners and stakeholders, and serves as a common blueprint for Ethiopia to achieve the FP goal set forth in the Health Sector Transformation Plan (2015/16–2019/20).

It is the conviction of the Ministry of Health that the full implementation of this CIP will enable Ethiopia to reach its goals and implement efforts to scale up the use of modern FP methods, as well as reduce regional disparities and inequities. This achievable task requires the concerted efforts of the government at the federal and regional levels, along with the active participation and ownership of communities and commitment from development partners and the private sector.

Finally, I would like to extend my acknowledgment to all who participated in the development of this plan, and assure them of the GOE's continued commitment to maintaining the outstanding past achievements in FP services and thus improve the health status of women and children.

**Kebede Worku (MD, MPH)**  
State Minister, Ministry of Health

## PREFACE

The July 2012 London Summit on Family Planning renewed the global community's enthusiasm and commitment to family planning (FP); in taking action, countries have begun developing costed implementation plans (CIPs). In mid-2014, Ethiopia began its Costed Implementation Plan for Family Planning, 2015–2020 under the direction of the Maternal and Child Health Directorate at the Ministry of Health. In September 2014, the Health Policy Project (HPP), funded by USAID, assembled a Technical Support Team to provide additional expertise.

Through May 2015, the Ministry, with the Technical Support Team, worked to (1) conduct a comprehensive situational analysis, including a desk review and consultations; (2) identify strategic priorities; (3) solicit strong stakeholder input (through group consultations and in-person meetings); (4) develop activities; and (5) estimate costs. The team was guided throughout the process by the Costed Implementation Plan Task Force, comprising high-level experts from the Ministry of Health, development partners, implementing partners, and FP advocates. The costs and impacts in this plan were revised in June 2016 to align it with the National Reproductive Health Strategy.

The Technical Support Team conducted more than 30 stakeholder interviews at the national level and more than 20 consultations with ministry officials and their partners in each of the nine regional states and two chartered cities. These stakeholder interviews and consultations solicited input on the following topics:

- Contraceptive security
- Human resources
- Health systems management
- Advocacy (including policy, resources, and enabling environment)
- Social and behaviour change communication
- General FP service delivery
- Youth-friendly FP/reproductive health services
- Integration of FP services into other health services and sectors
- Decentralization and family planning

The Technical Support Team presented the plan and activity matrix in various forms to expert groups, including the task force and Ministry of Health experts across technical areas. The team refined the plan based on this feedback and input. In addition, the team identified and considered global best and high-impact practices,<sup>1</sup> analysed them for applicability in Ethiopia, and included relevant activities in the CIP (including activities for piloting and evaluation before larger scale-up), as appropriate to the country context and according to the expert opinions of various stakeholders.

The team presented key questions to the ministry and stakeholders through ongoing group and one-on-one consultation meetings to ensure that the activities were feasible and the costing details were correct and aligned with local costs for implementation.

Finally, the ministry circulated draft versions of the activity matrix and complete CIP to its partners and stakeholders before the plan was finalised.

## ACKNOWLEDGEMENTS

The Ministry of Health would like to express its appreciation to the many partners and groups who supported development of the Costed Implementation Plan for Family Planning, 2015–2020. This document is the result of extensive consultations with stakeholders working at all levels, including key sector ministries, development partners, implementing partners, professional associations, and for-profit organizations working in aligned areas.

We appreciate the following government agencies with which the ministry works to ensure that FP programmes can be implemented effectively and efficiently:

- Ethiopia Central Statistical Agency
- Ministry of Finance and Economic Development
- Ministry of Women, Children and Youth Affairs
- Ministry of Urban Planning
- National Planning Commission, Population and Development Directorate
- Pharmaceuticals Fund and Supply Agency
- Health administrative at sub-regional and regional level

The following development partners, implementing partners, professional associations, and for-profit organizations also provided valuable input and feedback throughout the process via in-person meetings and online communications.

The Ministry of Health would also like to acknowledge the financial and technical support provided by USAID through the Health Policy Plus project made this publication possible.

Finally, the Ministry would like to acknowledge the efforts and dedication of its staff in coordinating the inputs of all stakeholders and developing this plan.

## EXECUTIVE SUMMARY

The Government of Ethiopia's (GOE) vision for the next five years is to improve the health and well-being of all Ethiopians. One of the strategies is scaling up family planning (FP) services using a rights-based approach. In line with this vision, Ethiopia has committed to increasing the modern contraceptive prevalence rate to 55 percent amongst married women by 2020 and reducing the total fertility rate to 3.0. The full implementation of this Costed Implementation Plan (CIP) for Family Planning, 2015–2020 by the Ministry of Health and development partners will enable Ethiopia to reach these ambitious goals.

The strategic priorities in the CIP represent key areas for financial resource allocation and implementation performance. These priorities reflect issues and interventions that must be acted on to reach the country's goals. Based on a desk review and key stakeholder interviews, a Technical Support Team identified **five strategic priorities**. These priorities serve as the foundations of the **thematic areas** for CIP activities:

- **Priority # 1—Demand Creation (DC):** To strengthen demand for and increase acceptability of FP services, especially long-term methods, by providing targeted, easily accessible, and accurate information to the population on the full method mix.
- **Priority # 2—Service Delivery and Access:** To increase the number of skilled providers delivering high-quality contraceptive services and to ensure access for all populations, especially youth and pastoralists, through an effective referral system, outreach and mobile clinics, and adolescent and youth-friendly sexual and reproductive health (SRH) services.
- **Priority # 3—Procurement and Supply Chain:** To improve the distribution of FP commodities and consumables from the central level to service delivery points by increasing the capacity of healthcare workers to manage the logistics system and the Pharmaceuticals Fund and Supply Agency (PFSA) by improving human resource and commodity supply chain logistics to manage the national supply chain.
- **Priority # 4—Monitoring and Coordination:** To improve multisectoral coordination in the planning, implementation, and monitoring of FP programmes at all levels.
- **Priority # 5—Financing:** To increase the budget allocation for family planning both at the federal and regional levels to ensure reproductive health commodity security.

The cost of the total plan is projected to be 6.2 billion Ethiopian Birr (ETB) or US\$285 million between 2015 and 2020, which will increase the number of women in Ethiopia currently using modern contraception from approximately 6.2 million users in 2014 to 10 million users in 2020. Between 2015 and 2020, the annual cost of the plan will be about US\$47.5 million. The interventions, activities, and accompanying costs in this plan will help the Ministry of Health and partners to mobilise resources and monitor the implementation of the FP programme.

## SECTION 1: INTRODUCTION

During the past two decades, the Government of Ethiopia (GOE) has made significant progress in improving the access to and quality of family planning (FP) throughout the country. As the Ministry of Health (MOH) began to review and update key strategic plans for the health sector, it identified the development of a costed implementation plan (CIP) for family planning as essential for aligning the government and stakeholders around a common vision and outlining the activities and timeline for achieving key milestones. This document reflects the strategies, goals, and objectives of the GOE and its many partners and stakeholders, and serves as a common blueprint for Ethiopia to achieve the FP goal outlined in the Health Sector Transformation Plan HSTP (2016–2020): To scale up FP services through a rights-based approach.<sup>2</sup> This goal will be accomplished in line with the strategies set in the Reproductive Health Strategy (2016–2020).<sup>3</sup>

In addition, this Costed Implementation Plan for Family Planning in Ethiopia, 2015–2020 sets the following objective in support of achieving the national FP goal found in the HSTP: To increase the contraceptive prevalence rate (CPR) amongst married women and women in union from 42 percent in 2014 to 55 percent by 2020.

The activities outlined in this plan represent the building blocks needed to achieve this objective. Ultimately, implementation of the CIP will contribute to the improved health, rights, and well-being of the Ethiopian population.

### How to Use the CIP

Ethiopia has one of the highest fertility rates in Africa, with 45 percent of its population under age 15.<sup>4</sup> Although this high youthful population can be a great force for economic and developmental growth, to benefit from a demographic dividend, Ethiopia must first achieve a demographic transition—move from high to low birth and death rates, so there is a larger number of this population in the work force (ages 15–64) caring for a smaller number of dependent children. These shifts in age structure will allow households to save more money and invest more in the well-being of a smaller number of children. In addition, whereas a more balanced age structure is needed to open the window of demographic opportunity, Ethiopia must also make the necessary investments in integrated demographic, economic, and social programmes to improve the health, education, and welfare of the population to realise this demographic dividend.<sup>5, 6</sup>

Ethiopia's strong investments in the health sector have contributed to significant progress over the last 10 years in reducing infant and child mortality, increasing the use of contraception, and reducing fertility rates. However, fertility and population growth rates remain high, at 4.1 and 2.6 percent, respectively.<sup>7, 8</sup> Continuing to lower fertility and shifting the age structure are important first steps towards achieving a demographic dividend and meeting the country's development goals. The activities outlined in this plan will contribute greatly to achieving these objectives.

The CIP is the guide for all FP programming across all sectors and amongst the government in partnership with development and implementing partners. It details the necessary programme activities and the costs associated with achieving national goals by providing clear programme-level information on the resources the country must raise domestically and from partners. The plan gives crucial direction to Ethiopia's FP programme, ensuring that all components of a successful programme are addressed and

targeted in the budgets of government and partner programming, including all of those engaged in FP service provision.

More specifically, the CIP will be used to

- Ensure that one unified country strategy for family planning is followed: The CIP articulates Ethiopia's consensus-driven priorities for family planning—derived through a consultative process—and is thus a social contract for the government, development partners, and implementing partners. The plan will (1) help ensure that all FP activities are aligned with the country's needs, (2) prevent fragmentation of efforts, and (3) guide current and new partners in their FP investments and programmes. All stakeholders must align their FP programming to the strategy detailed in this document. In addition, the MOH will hold development and implementing partners accountable for their planned activities and realign funding to the country's priority needs. Given the cross-sectoral nature of many FP programmes, the MOH will coordinate and collaboratively work with other ministries to implement the CIP.
- Define key activities and an implementation roadmap: The CIP includes all necessary activities, with defined targets appropriately sequenced, to deliver the outcomes needed to reach the country's FP goals by 2020.
- Determine impact: The CIP includes estimates of the demographic, health, and economic impacts of the FP programme, providing clear evidence for advocates to use to mobilise resources.
- Define a national budget: The CIP determines detailed commodity and programme activity costs associated with the entire national FP programme. It provides concrete activity and budget information to inform the MOH budget requests for FP programmes aligned with national goals between 2015 and 2020. It also provides guidance to the ministry and partners to prioritise the funding and implementation of strategic priorities.
- Mobilise resources: The CIP should also be used by the GOE and partners to mobilise needed resources internally, as well as those from development partners. The plan details the activities and budget required for the public sector to implement a comprehensive FP programme, so the MOH and partners can systematically track available resources against those required and conduct advocacy to mobilise funds from development partners to fill any remaining funding gaps.
- Monitor progress: The CIP's performance management mechanisms, including semi-annual reviews, measure the extent of activity implementation and help ensure that the country's FP programme is meeting its objectives; these mechanisms also help to ensure coordination and guide any necessary course corrections.

This CIP document was finalised during an opportune time, when several other key MOH five-year strategies were being developed. The CIP's goals, objectives, and implementation framework are in alignment with the country's Reproductive Health Strategy (2016–2020) and the HSTP (2016–2020). Various technical working groups overseeing these respective strategic plans worked in close coordination to ensure the strategies and plans can be smoothly implemented and efficiently monitored.

## The Global Context

Scaling up FP services is one of the most cost-effective interventions to reduce maternal, infant, and child morbidity and mortality globally. FP interventions helped to achieve the Millennium Development Goals (MDGs) and are expected to achieve the newly established Sustainable Development Goals (SDGs). Family planning can prevent unintended pregnancy and thus reduce maternal deaths. It also indirectly contributes to positive health outcomes. For example, FP interventions help to reduce poverty, increase gender equity, prevent the spread of HIV, and lower infant deaths.<sup>9</sup> Currently, more than 200 million women in developing countries desire to space or limit pregnancies, yet they lack access to FP options. Amongst women of reproductive age in developing countries, 57 percent (867 million women) are in need of contraceptive access because they are sexually active but do not want to have a child in the next two years. Of these women, 645 million (74%) are using modern methods of contraception; the remaining 222 million are not, resulting in significant unmet need for modern FP methods.<sup>10</sup>

### Family Planning 2020 (FP2020)

The UK Department for International Development and the Bill & Melinda Gates Foundation partnered with the United Nations Population Fund (UNFPA) to host a gathering of leaders from national governments, development partners, civil society, the private sector, the research and development community, and other interest groups to renew and revitalise global commitment to ensuring that the world's women and girls, particularly those living in low-resource settings, have access to contraceptive information, services, and supplies.<sup>11</sup> The resulting event, the London Summit on Family Planning, was held on July 11, 2012. At the summit, implementers,

#### Figure 1: Ethiopia country commitments to FP2020

**Commitment 1:** Ethiopia's objectives are to increase the CPR to 55 percent; reduce total fertility rate (TFR) to 3; and reach an additional 6.2 million women and adolescent girls with FP services by 2020.<sup>1</sup>

**Commitment 2:** Ethiopia commits to increasing the budget allocation for family planning each year. The current funding gap is 50 percent.

**Commitment 3:** Contraceptive use has doubled in Ethiopia since 2005. The government will further increase its funding to uphold the rights of all people to access and choose voluntary family planning through a strong network of primary healthcare providers.

**Commitment 4:** Ensure commodities security.

**Commitment 5:** Increase the uptake of long-acting reversible methods (LARMs).

**Commitment 6:** Expand youth-friendly services, with a focus on adolescent girls.

**Commitment 7:** Scale up the delivery of services for the hardest-to-reach groups.

**Commitment 8:** Monitor the availability of contraceptives.

<sup>1</sup> Originally, Commitment 1 was "Ethiopia's objectives are to increase the CPR to 69 percent by 2015 (currently 29%), reduce TFR to 4 by 2015 (currently 4.8), and reach an additional 6.2 million women and adolescent girls with family planning services." The goal has been modified in accordance with the new Health Sector Transformation Plan V (2015–2020).

governments, and FP stakeholders united to determine priorities and set forth commitments.

The summit aimed to “mobilize global policy, financing, commodity and service delivery commitments to support the rights of an additional 120 million women and girls in the world’s poorest countries to use contraceptive information, services and supplies, without coercion or discrimination, by 2020.”<sup>12</sup> Achieving this ambitious target would prevent a staggering 100 million unintended pregnancies, 50 million abortions, 212,000 childbirth-related and maternal deaths, and 3 million infant deaths.<sup>13</sup> The GOE made several significant commitments hand in hand with other governments and stakeholders (see Figure 1).

The London Summit on Family Planning called on all stakeholders to work together on various areas,<sup>14</sup> including the following:

- Increasing the demand and support for family planning
- Improving supply chains, systems, and service delivery models
- Procuring the additional commodities countries will need to reach their goals
- Fostering innovative approaches to FP challenges
- Promoting accountability through improved monitoring and evaluation

### ***Sustainable Development Goals***

Building on the commitments of the MDGs, the global SDGs have been newly proposed by the United Nations to address domestic and global inequalities by 2030. Proposed Goal 3 aims to “ensure healthy lives and promote well-being for all at all ages.” Further, the sub-activity states the following:

- 3.1: By 2030, reduce the global maternal mortality ratio to less than 70 per 100,000 live births.
- 3.7: By 2030, ensure universal access to sexual and reproductive health services, including family planning, information and education, and the integration of reproductive health into national strategies and programs.<sup>15</sup>

Further, Proposed Goal 5, “achieve gender equality and empower all women and girls,” includes sub-activity 5.6: To ensure universal access to sexual and reproductive health and reproductive rights as agreed in accordance with the Programme of Action of the International Conference on Population and Development and the Beijing Platform for Action and the outcome documents of their review conferences. Given the focus placed on family planning and equitable access, if the necessary resources, political will, and in-country priority are provided, the SDGs are set to achieve substantial impact outcomes.<sup>16</sup>

## **The Ethiopian Context**

### ***Overview***

Ethiopia’s population increased from 22.2 million in 1960 to 90 million in 2015.<sup>17</sup> With an annual growth rate of about 2.6 percent, the population is projected to reach 112 million by 2020.<sup>18</sup> The progressively declining fertility rate (from 5.9 live births per woman in 2000 to 4.1 in 2014) is expected to slow down the rate of population growth.<sup>19, 20</sup> Preferences for larger families, traditions of women marrying at a very young age, the high drop-out rates for girls from school, and unintended pregnancies as a result of low contraceptive use all contribute to high fertility in Ethiopia.<sup>21</sup> With more than half of the total population age 20 and under, a shift in population distribution to a

more balanced age structure may take some time. The increase in FP use and scaling up of girls' education will support this balance.

The delivery of FP services is also an important strategy for reducing maternal morbidity and mortality. Multicountry studies have shown that accessing family planning can reduce maternal deaths by as much as 40 percent,<sup>22, 23</sup> infant mortality by 10 percent, and childhood mortality by 21 percent.<sup>24</sup> The main causes of maternal mortality are haemorrhage, hypertension during pregnancy, obstructed labor, infection, and abortion.<sup>25, 26</sup>

The country has made significant progress by reducing the maternal mortality ratio by 69 percent (from about 1,400 in 1990 to 420 per 100,000 live births in 2013). The MDG of Ethiopia related to maternal mortality is to reduce maternal mortality further, to a ratio of 267 per 100,000 live births by 2015.<sup>27</sup> As a complementary intervention, the country must continue its efforts to improve access to and the quality of FP services, so that Ethiopian women of reproductive age can live long, healthy, and productive lives. Beyond achieving these health-related goals, FP programmes can have a multitude of positive effects. In Ethiopia, every dollar invested in family planning results in more than US\$2 of savings in other development areas.<sup>28</sup>

### *Unintended pregnancies*

Unintended pregnancies lead to high levels of unplanned births, unsafe abortions, and maternal injury and death. About a decade ago, Ethiopia had one of the highest maternal mortality ratios in the world, with low availability of contraception resulting in more than 40 percent of pregnancies being unplanned and more than 2 percent of women of reproductive age seeking an abortion every year.<sup>29</sup> Policy changes allowing for abortion in certain instances have dramatically reduced abortion-related mortality;<sup>30</sup> however, the high rate of abortion remains a serious concern and indicates a need to improve the accessibility of contraception to prevent unwanted pregnancies. Although the health extension worker (HEW) programme has substantially increased the availability of contraceptives, a high unmet need for family planning still exists, especially amongst adolescent girls.<sup>31</sup>

### *Contraceptive use*

In 2014, 42 percent of married women of reproductive age (15–49 years) were using FP methods.<sup>32</sup> As Figure 2 shows, Ethiopia has achieved impressive growth in its CPR since 2000. Use of modern FP methods increased considerably, with the availability and use of injectable contraceptives providing the largest increase. Building on this positive trend, the CPR needs to increase substantially over the next six years to reach the goal of 55 percent set in the HSTP (2016–2020).<sup>33</sup>

**Figure 2: Contraceptive use trends amongst married women of reproductive age, by method, 2000–2014<sup>34, 35</sup>**

The successful deployment of the HEW programme coincides with increases in the CPR over the last 15 years. Ethiopia’s track record in consistently increasing FP uptake has often been cited as a global success story. Many Ethiopian women have opted for injectables, likely due to their ease in administration, ability to use them privately, and their longer period of action than other short-term methods, such as pills or condoms. As the country continues its efforts to increase FP uptake through a rights-based approach, it will be vital that every woman is aware of the options available to her for delaying, spacing, and preventing pregnancy, and that she has access to whatever method she chooses.

Disparities in contraceptive use exist by age, marital status, education, religion, socioeconomic status, and rural-urban geographic location. Married women ages 25–40 have a substantially higher use of modern contraceptive methods compared with adolescents, whereas demand amongst women between ages 15 and 44 is relatively constant, ranging between 52 to 59 percent. Nearly one in three adolescent girls has an unmet need for contraception,<sup>36</sup> and recent data from the Performance, Monitoring and Accountability 2020 (PMA2020) project suggests that whereas unmet need is decreasing amongst married women, it is continuing to increase amongst unmarried adolescents.<sup>37</sup> Women in the lowest wealth quintile have the lowest levels of use, regardless of marital status, with women in the highest quintile more than twice as likely to use contraception. The CPR amongst women in urban areas is higher compared to women in rural areas, with clear regional differences. As Figure 3 shows, Addis Ababa has the highest CPR, at more than 64 percent for married women, and the Somali region has the lowest, with less than 2 percent of married women using any modern contraceptive method.<sup>38</sup>

Figure 3: Contraceptive use amongst currently married women using any modern contraceptive method, by region, 2014<sup>39</sup>

Fifty-five percent of Ethiopia's population is under age 20, with nearly 34 percent of the population ages 10–24.<sup>40</sup> Adolescents and young adults are particularly at risk for unintended pregnancy, and high rates of adolescent marriage lead to high-risk pregnancies amongst these groups. Fifty-eight percent of girls in Ethiopia are either pregnant or have given birth by the time they turn 20.<sup>41</sup>

### *Unmet need*

Unmet need is the percentage of women who want to space their births or do not want to become pregnant but are not using contraception.<sup>42</sup> Twenty-five percent of married women of reproductive age had an unmet need for family planning in 2011;<sup>43</sup> however, recent data from PMA2020 suggest that improvements in contraceptive availability have reduced unmet need to 24.4 percent.<sup>44</sup> Amongst married women reporting unmet need, nearly two-thirds expressed a desire to space their pregnancies (16%), whereas the remaining one-third (9%) expressed a desire to limit (cease childbearing).<sup>45</sup> Women in rural areas report higher levels of unmet need, at 27 percent, compared with their counterparts in urban areas, at 15 percent.<sup>46</sup> Women in the highest wealth quintile have the lowest level of unmet need, at 14 percent, whereas the remaining four quintiles have unmet need ranging from 26.5 to 30.5 percent.<sup>47</sup>

## Key Issues and Challenges

The FP programme faces challenges that must be overcome to meet the country's FP goals of a 55 percent CPR by 2020.

### *Demand creation (DC)*

Knowledge of family planning is an important determinant for increased FP use.<sup>48</sup> The majority of Ethiopians know of at least one method of contraception, with 97 percent of

women being able to name at least one method.<sup>49</sup> However, knowledge about long-acting reversible and permanent methods is significantly lower, with only 39 percent of women knowledgeable about intrauterine devices (IUDs) or sterilisation. Modern contraception uptake is hindered by misconceptions, misinformation, and misinterpreted side effects.<sup>50</sup>

Some traditional cultural and religious beliefs also serve as substantial barriers to increasing the modern CPR (mCPR). In Ethiopia, gender inequalities commonly affect women's ability to make decisions in the household. This power dynamic often limits a woman's ability to choose to use contraceptives, leading to lower FP uptake in households where there are negative sociocultural sentiments about women's decision-making abilities.<sup>51</sup> In Ethiopia, women's empowerment and contraceptive use correlate positively.<sup>52</sup> Religion also can act as a significant barrier to family planning. There is a well-accepted belief in some parts of Ethiopia that religion prohibits the use of modern FP methods. This belief creates an impediment to demand.<sup>53</sup>

### ***Service delivery and access***

In Ethiopia, most health facilities have the capacity to provide short-acting FP methods, as well as the basic infrastructure and provider interest to offer long-acting reversible contraceptives (LARCs).

In addition, HEWs, a cadre of providers who deliver primary healthcare, especially in areas of the country where access is limited, are vital in improving FP access by the rural population. However, accessibility varies across regions, with emerging regions<sup>2</sup> especially lacking access to FP services. There are also variations amongst population groups; for example, youth have less access to family planning. Moreover, availability of and access to a range of FP methods is a problem; the majority of FP users still depend on short-acting methods, particularly injectables, and the use of long-acting reversible and permanent methods remains extremely low. Implants are the most popular LARC, with 12 percent of contraceptive users opting for this method.<sup>54</sup>

FP commodities should be accessible to both men and women, including youth. Access to FP counselling is also a critical element of a successful FP programme. Numerous supply-side barriers hinder access to FP services in Ethiopia; for example, clients are often unable to access counselling and receive commodities due to geographical distances and lack of supplies or equipment at facilities. Although the HEW programme has dramatically increased access to FP information and short-acting methods (condoms, pills, and injectables), women seeking long-acting reversible and permanent methods often travel long distances to reach health facilities providing a full method mix. Additionally, sporadic stockouts of FP commodities at facilities and long wait times for service further impede access. Reducing inequities related to poverty, gender, age, and marital status; counselling; and access to and use of family planning are continuing challenges. Unmarried sexually active youth also face a unique set of challenges related to access, due to provider bias and cost of FP services through the private sector.<sup>3, 55</sup>

---

<sup>2</sup> "Emerging regions" include Affar, Somali, Benishangul-Gumuz, and Gambela; these regions are often grouped together as target geographical areas for health service improvement, as they are sparsely populated, have less health infrastructure, and are home to pastoralists, all of which pose unique challenges to ensuring that health services are available and accessible.

<sup>3</sup> Youth are more likely to access FP services through the private sector. Twenty-three percent of modern contraceptive users ages 15–19 accessed family planning most recently through the private sector as compared with 13.4 percent for all age groups.

Health service delivery is decentralised, with regions and woredas responsible for delivery and management of health services at lower levels. The Ethiopian health service has been restructured into a three-tier system.

- 1) *Specialised hospitals*: Provide specialised health services and referrals; cater to a catchment population of 3.5–5 million people.
- 2) *General hospitals*: Provide inpatient and ambulatory services to an average of 1,000,000 people.
- 3) *Primary health care unit*: Composed of a primary hospital, a health centre (HC), and five satellite health posts that provide services to a population of 25,000. The primary hospital provides inpatient and ambulatory services to an average population of 100,000. In addition to what an HC can provide, a primary hospital provides emergency surgical services, including caesarean sections, and gives access to blood transfusion services. It also serves as a referral centre for HCs under its catchment areas and a practical training centre for nurses and other paramedical health professionals.

Figure 4: Ethiopian health tier systems

As Figure 5 below shows, nearly all FP demand in Ethiopia is satisfied through the public sector with the exception of male condoms, which are also distributed through private sector pharmacies (27%) and shops (51%).

**Figure 5: Source of modern contraceptive methods accessed, by all current modern method users ages 15–49 (2011)<sup>56</sup>**

Note: "All modern methods" include "Other" modern methods but exclude the lactational amenorrhoea method and standard days method.

### **Contraceptive security**

At the London Summit on Family Planning, the GOE committed to increasing commodity security, which aims to ensure that the full spectrum of contraceptive commodities and related supplies are adequate and available to meet the needs and choices of FP clients.

Providing a choice of FP methods to meet the changing needs of clients throughout their reproductive lives increases overall levels of use and enables individuals and couples to meet their reproductive goals and safeguard their human rights. The method mix available influences not only successful client use and satisfaction, but also has implications for provider confidence and competence.

In Ethiopia, the MOH, in collaboration with the Pharmaceuticals Fund and Supply Agency (PFSA) and relevant stakeholders, is responsible for forecasting, quantifying, and initiating procurement of contraceptive commodities. The PFSA is responsible for the procurement, storage, and distribution of contraceptives and consumables from the central warehouse all the way to the service delivery points.

The National Growth and Transformation Plan has made the availability of pharmaceuticals a priority, and procurement lead time has gone down from 240 days in 2010 to 140 days in 2012.<sup>57</sup> The PFSA currently operates 10 distribution hubs nationwide, with an additional six warehouses to be added in 2015. From the regional hubs, the commodities and supplies are distributed down to the health centre level.

HEWs travel to health centres to acquire the necessary commodities for their health posts.

The government and stakeholders agree that at the national level, commodities are more reliably available.<sup>58</sup> At service delivery points, stock availability has increased over recent years; however, there are still challenges in getting the commodities from the health centres to the health posts, with the majority of challenges occurring in emerging regions.<sup>59</sup>

### ***Monitoring and coordination***

Achieving FP objectives will take multisectoral coordination with many other government ministries, stakeholders, and partners. Additionally, service provision requires ongoing communication between all levels of the government—from the Kebele (community) to the federal level.

Various ministries have undertaken initiatives that can positively affect FP uptake and build on each other. Establishing mechanisms to enable frequent communication and collaboration can ensure that opportunities are not missed. For example, although the GOE has made it a priority to target youth, the MOH; Ministry of Women, Children and Youth Affairs; and Ministry of Education (MOE) are still working on a collaborative approach to developing and implementing FP programmes. The MOH is working with regions to fully understand the ministry's FP objectives; FP plans will be developed at the regional level to effectively operationalise national FP goals and objectives. Consultations with stakeholders have identified a need for increased communication between the federal and regional governments, and raised the issue of further developing the technical capacity of regional health bureau (RHB) staff as a critical requirement for them to improve coordination and implementation of FP programmes.<sup>60</sup>

The private sector can play an important role in increasing the availability of FP services for urban and peri-urban populations in Ethiopia. As noted earlier, 87 percent of current users obtaining male condoms acquired them from a non-public source.<sup>61</sup> Approximately 26 percent of reproductive healthcare costs are spent at private health facilities.<sup>62</sup> Many key health and FP policies and strategies recognize the value that the sector brings to the table; thus, the role of the private sector in providing FP services currently is being strengthened under the HSTP.

Effective FP programming and implementation requires the availability and use of accurate monitoring data. Ethiopia has an extensive health information management system to gather data from the Kebele level up to the national level.

However, data are often not effectively analysed and used for decision making at the subnational level. Timely entry of accurate data at the sites and full analysis and use of data will be critical in ensuring that sites have the necessary trained staff and commodities to provide counselling and the full spectrum of FP services.

### ***Financing***

Although Ethiopia's total health expenditure (THE) doubled between 2007—2008 and 2011—2012, 34 percent of this funding comes from households. Heavy reliance on out-of-pocket payments is undesirable, as it can make healthcare inaccessible to vulnerable households. To expand and ensure access to healthcare services for all and to protect households from catastrophic expenditures, the GOE is working to identify alternative and sustainable domestic sources for financing healthcare.

Figure 6: Ethiopia total health expenditure trend, 2004–2011

The proportion of funding available for reproductive health has increased over the past decade, from 12 to 13 percent (see Figure 5).<sup>63,64</sup>

In recent years, regional ownership for financing health has grown. More than half of the government’s financial contribution to health is from regional and local governments. Two regions (Amhara and SNNPR) and Addis Ababa recently earmarked 3.3 million Birr for FP programmes and commodity procurement for 2015.

## SECTION 2: COSTED IMPLEMENTATION PLAN

The MOH developed the CIP based on the government's FP2020 pledges made in 2012 and in line with other health sector strategies, particularly the HSTP (2016–2020)<sup>65</sup> and the Reproductive Health Strategy (2016–2020). Through extensive consultation with stakeholders, the CIP's priorities and activities have been refined. The plan clearly defines the country vision, goal, strategic priorities, interventions, and inputs, and presents the estimated cost to achieve them. The CIP details the strategic priorities that will help the government and nongovernment sectors meet the national targets for increasing the CPR and number of women reached with rights-based FP services and for reducing the TFR by 2020.

The CIP specifies the interventions and activities to be implemented, and itemises the financial and human resources needed to meet the comprehensive national FP goals.

### Operational Goals

- Increase the CPR amongst married women from 42 percent in 2014 to 55 percent by 2020<sup>66</sup>
- Reduce the TFR from 4.1 in 2014 to 3.0 in 2020<sup>67</sup>
- Reach 6.2 million additional women and adolescent girls with FP services by 2020 as compared to 2011<sup>68</sup>

### Strategic Priorities

The strategic priorities in the CIP represent key areas for financial resource allocation and implementation performance. Strategic priorities reflect the issues and interventions that must be acted upon to reach the country's goals. Based on a desk review and key stakeholder interviews, a Technical Support Team from the Health Policy Project (HPP), funded by USAID, identified **five strategic priorities**. These priorities serve as the foundations of the **thematic areas** for CIP activities:

- **Priority # 1—Demand Creation:** To strengthen demand for and increase acceptability of FP services, especially long-term methods, by providing targeted, easily accessible, and accurate information to the population on the full method mix.
- **Priority # 2—Service Delivery and Access:** To increase the number of skilled providers delivering high-quality contraceptive services and ensure access for all populations, especially youth and pastoralists, through an effective referral system, outreach and mobile clinics, and adolescent and youth-friendly sexual and reproductive health (SRH) services.
- **Priority # 3—Procurement and Supply Chain:** To improve the distribution of FP commodities and consumables from the central level to service delivery points by increasing the capacity of healthcare workers to manage the logistics system and the PFSA by improving human resource and commodity supply chain logistics to manage the national supply chain.
- **Priority # 4—Monitoring and Coordination:** To improve multisectoral coordination in the planning, implementation, and monitoring of FP programmes at all levels.
- **Priority # 5—Financing:** To increase the budget allocation for family planning both at the federal and regional levels to ensure reproductive health commodity security.

### ***Intervention and activity mapping to FP2020 commitments***

The GOE is determined to meet its FP2020 commitments, which prioritise outreach to specific population groups and an increase in uptake of LARCs—interventions that cut across core components of an FP programme. When resources are limited, they should be directed to areas that have the greatest potential to meet those commitments and reduce the unmet need for family planning. In the case of a funding gap between resources required and those available, FP2020 activities should be given precedence to ensure the greatest impact and progress towards the objectives laid out. These activities will enable the MOH to focus resource and time investments on coordination and leadership for CIP execution. However, all of the components necessary for a comprehensive FP programme (all of the activities that support, complement, and complete the FP programme) have been detailed by activities and costed; the strategic priorities of the plan will be used to guide national priorities for additional and new funding and programme development.

All activities under the five thematic areas will address the eight FP2020 goals. Notably, while the CPR, TFR, and uptake goals presented in Commitment 1 are cross-cutting in nature, Thematic Area 5 will speak more to Commitments 2 and 3 (increase financing for family planning). Thematic Area 3 will contribute to Commitment 4 (commodity security). Thematic Areas 1 and 2 will especially align with Commitments 5, 6, and 7 (increase uptake of LARCs and expand service delivery for youth and hardest-to-reach groups). Thematic Area 4 will contribute to Commitment 8 (monitor contraceptive availability).

## **Thematic Areas**

Across the five thematic areas, there are 23 strategic outcomes for implementing a full FP programme in Ethiopia. Each thematic area is further detailed with expected results, activities, sub-activities, inputs, outputs, and timeline information. Refer to Annex A: Implementation Framework with Full Activity Detail.

### ***Demand creation (DC)***

#### *Strategy*

The wide gap between knowledge about contraceptives and their use indicates the need for a focused communications strategy to ensure FP programme coordination and increase demand. A behaviour change communication (BCC) strategy will be developed to streamline communication efforts with consistent messages targeting priority groups. The BCC strategy will be informed by formative and assessment research. Campaigns should be adaptable for different cultural audiences and populations.<sup>69</sup> For example, campaigns that speak to the needs of the population will often need to be specific to regions or even districts. Thus, regional input and stakeholder engagement in the strategy development process will be critical. The formative research will outline the knowledge, attitudes, and perceptions of the audience so the campaign addresses the actual needs of the target population.<sup>70</sup> Successful campaigns can result in increased demand, increased acceptance of family planning amongst family members, increased knowledge and access to FP services, and informal peer-to-peer advocacy for FP methods amongst users.<sup>71</sup>

Once an evidence-based strategy is developed, a series of demand creation activities will be implemented at the national, subnational, community, and interpersonal levels. Multiple media outlets—including mass media; information, education, and communication materials; interpersonal communications; advocacy campaigns; and champions—will increase demand and uptake of services.<sup>72</sup> By increasing knowledge

and awareness of family planning at all of these levels, the demand creation strategy will increase the desire to access FP services and lower the barrier to access.

In addition, specific demand creation efforts will be targeted at youth (ages 15–19), community and religious leaders, and men as husbands and fathers. Youth have a tendency not to access FP services, as they do not feel they need to “plan a family”; thus, the BCC strategy will utilise appropriate terminology to help overcome this barrier. Meanwhile, there is a rising trend amongst urban youth to access emergency contraceptives on an ad hoc basis rather than using contraceptives more consistently and appropriately to their health needs and reproductive desires. Demand creation activities that make the full spectrum of contraceptives better understood and more relevant to youth can significantly improve the welfare of the population through the prevention of unintended pregnancies.

Community and religious leaders strongly influence women’s decision to access family planning. Historically, traditional, community, and religious leaders have perceived FP use negatively. However, with concerted outreach efforts that listen to and address their concerns, these leaders can become some of the strongest supporters for family planning in their communities. Successful partnership efforts by the Benishangul-Gumuz RHB with local sharia leaders to support family planning within their communities are good examples of how government and religious leaders can work together to support FP use to improve the health of community members.<sup>73</sup> MOH and RHBs will identify and work more with national- and community-level leaders to improve the acceptability of family planning.

Although men share responsibility for reproductive health decisions, lack of a specific focus on them can lead to the belief that family planning is not men’s concern. However, male involvement is crucial to a successful demand creation campaign. Barriers for uptake include power and gender dynamics that inhibit women from making open decisions about FP use in their households. Providing information to men about how family planning can improve health outcomes for women and children, as well as dispelling myths and misconceptions, is important in ensuring their support.<sup>74</sup>

Ultimately, women must feel empowered and knowledgeable about family planning to make the decision to access it. Embracing family planning as a community, such as by providing an opportunity for satisfied FP users to share their stories through the Health Development Army (HDA), will increase community and women’s awareness that FP decisions not only can be made by women, but that this kind of decision making about their health and reproductive outcome is a core right of all women. Combined with the demand creation campaign focusing on influencers such as community leaders and husbands, mass media campaigns on women’s rights to FP decision making will increase acceptance.

### *Strategic outcomes*

**DC1. Increase awareness of available FP methods and how to access them by developing and executing a comprehensive BCC strategy tailored to specific target groups and cross-cutting issues:** To increase FP acceptability, a comprehensive BCC strategy will be developed. The MOH will spearhead this strategy development process, in consultation with RHBs and other key stakeholders for FP programme implementation. The FP Technical Working Group (TWG) will identify key target groups and priority cross-cutting issues to address through demand creation activities. Potential target groups include young married women, youth ages 15–19, men, pastoralists, community leaders, and service providers. Cross-cutting issues to be tackled by BCC include addressing myths and misconceptions

about family planning, especially around LARCs; the intersection of religion and FP use; women's empowerment and access to family planning; and regional and cultural backgrounds as they relate to FP acceptability and use.

**DC2. Increase awareness of and demand for family planning, especially LARCs:** Using the key messages developed by the new communications strategy, targeted BCC campaigns will be developed to increase FP awareness and knowledge. Mass media will be leveraged to reach the population nationally, and existing outreach models, such as the HDAs and use of the HEWs, will be leveraged to reach target communities at a more personal level. Innovative mobile platforms will be used to provide access to information about family planning on demand, such as the Mobile 4 Reproductive Health systems in operation in Kenya and Tanzania.<sup>75</sup> This outreach mechanism is believed to be most optimal for youth ages 15–24.

**DC3. Increase awareness of and demand for FP services amongst both in- and out-of-school youth:** To improve the knowledge of sexual and reproductive health and family planning as they relate to married and unmarried youth, demand creation activities will focus on improving the quality and depth of information available to youth. Peer educators, both male and female, will be trained to provide accurate FP and reproductive health information and promote health-seeking behaviour amongst both male and female youth. Communication materials specifically targeting youth will be distributed through youth centres and schools. Furthermore, support systems for youth—parents, caregivers, and teachers—will be given the tools to advise them effectively on why family planning is relevant to them, how it can impact their health, and how FP use can benefit their welfare by preventing unintended pregnancies.

**DC4. Establish and sustain engagement with national- and community-level advocates of family planning, including traditional and religious leaders:** To increase the engagement of community and religious leaders who have the ability to promote family planning within the community, the MOH and RHBs will take a step-by-step approach. First, they will engage the leaders and address their concerns. Through these discussions, the MOH and RHBs then will identify FP champions. Leaders already working in health will be cultivated, leveraging their ongoing work by integrating family planning into it, and tools will be developed to support FP advocacy.

**DC5. Increase male engagement in FP issues:** Special Men's Day events will be held at the regional level to raise awareness of family planning amongst men. In addition, male role models will be selected and cultivated to provide community leadership and guide group education, including discussion sessions and participatory methods for learning. Additionally, these male role models will conduct community outreach and mobilisation. While increasing men's support of women's FP-related rights, male engagement activities will focus on countering the concept of family planning as only a women's issue. In addition, other activities will include men as a target group for specific programming and messaging, including strategies DC1 and DC3.

**DC6. Build capacity of women to ensure they are knowledgeable of their rights for making FP decisions and empowered to act on them:** To increase women's empowerment within the community, especially in rural areas and emerging regions, existing programmes will be leveraged to include family planning within women's empowerment activities. Also, HDA activities will feature women who are satisfied with family planning to build other women's confidence in their knowledge of and ability to make an informed choice about family planning while feeling that the community is supportive of their decisions. These activities will complement the demand creation activities amongst community leaders

and men (outlined in strategies DC3, DC4, and DC5), as well as a mass media campaign (outlined in DC2) to raise awareness of the rights of women to make FP decisions and address community norms that act as barriers to contraceptive access.

### ***Service delivery and access (SDA) Strategy***

Ethiopia's strategy focuses on making a wide range of high-quality methods available and accessible while ensuring rights and equity amongst regions and population groups. Primary focus will be placed on increasing the number of FP service providers who can appropriately counsel and deliver a full range of methods by implementing a series of trainings throughout the country, especially in the pastoralist and emerging regions. Some of the activities that will support access to service delivery include an expansion of established networks of providers, development of mobile outreach services for family planning, and increased training for HEWs in these hardest-to-reach regions.

Uptake of long-acting methods is disproportionately low, partly due to the lack of appropriate skills amongst service providers at all levels. Thus, emphasis will be placed on increasing the clinical capacity of providers to administer long-acting reversible and permanent methods, and reduce provider bias towards shorter-term methods. In combination, the health system will be strengthened to improve the availability, accessibility, and quality of FP services to promote full access, choice, and rights. Referral systems will be streamlined so that women can more easily access FP services at higher-level facilities. New guidelines will be developed to integrate other reproductive, maternal, newborn, and child health (RMNCH) services with family planning. Facilities will be upgraded to improve privacy—a right for women accessing services and a factor critical to ensuring quality of service delivery.

Young people ages 15–19 in Ethiopia have high unmet need for family planning. They experience stigma, providers often refuse to offer FP services to them due to their age or marital status, and services fail to provide them with privacy and confidentiality. Accordingly, this strategy prioritises building additional FP access points for youth by instituting youth corners in health facilities, training service providers in youth-friendly services, increasing the capacity of youth centre staff to provide FP information and education, and strengthening the capacity of college and university clinics to provide high-quality FP information and services.

### *Strategic outcomes*

**SDA1. Increase the number of trained health providers at all levels to provide the full spectrum of FP services:** Currently, three out of four women rely on injectables for contraception. To address this reliance on a single method and promote access to a full spectrum of FP methods and services, all service providers will be trained to provide the entire range of FP services available at their level, with a rights-based focus. A pool of trainers will be created at the regional level. These trainers will train nurses and midwives on the full spectrum of FP methods, with emphasis on counselling and LARCs. Moreover, physicians and health officers will be trained on both LARCs and permanent FP methods to ensure that the full method mix is available to the population. The expansion of available services at all service delivery levels will likely result in a shift in method mix to a more balanced distribution.

**SDA2. Strengthen the referral system to streamline and simplify the process for women to access higher-level health facilities for FP services:** When some FP methods are not available at a facility, clients will be referred to a higher-level facility so they can access their method of choice. Thus, the referral system and feedback mechanism need to be institutionalised and strengthened. A handout on the use of referral and feedback forms

will be developed and then distributed to the regions, woredas, and facilities. Service providers will also be oriented as to the importance of referral and feedback forms for increasing their awareness.

**SDA3. Increase availability and accessibility of high-quality FP services in emerging regions:** Some emerging regions lack access to a range of FP methods due to the significant distance from the community to the health facility. Accordingly, regional trainer pools will be developed and used to train health professionals on inserting and removing implants and IUDs, so that LARCs are available at the community level. Moreover, mobile outreach services will be piloted in emerging regions to increase access to LARCs and address geographic barriers to services provided at higher-level health facilities.

**SDA4. Increase quality of FP services, especially in the area of counselling, privacy, and informed choice:** Rights-based FP programmes can be measured by the quality of counselling, which is vital to realise informed choice and maintain privacy and confidentiality. Characteristics of high-quality FP service delivery include the provision of appropriate and complete information to clients, freedom for the client to choose, client-provider interaction that is professional and confidential and respects informed choice, and technically competent staff with the appropriate tools and supplies to provide adequate service. Combined with the medical skills capacity-building training covered under SDA1, FP services providers will be trained in counselling techniques that acknowledge privacy and informed choice. The culture of quality improvement will be institutionalised by establishing quality assurance teams within health facilities. Furthermore, the MOH and RHBs will work together to assess and identify facilities that need renovation to ensure clients' right to privacy during FP counselling. Based on the assessment findings, selected health facilities will be renovated.

**SDA5. Increase FP uptake by increasing opportunities for women to access FP services through RMNCH service integration:** Integrating family planning into other RMNCH services, such as antenatal care, delivery, and child immunisation services, will play a paramount role in improving FP uptake and reducing unmet need. The MOH will develop a service integration manual and train nurses, midwives, and health officers on integrated services provision, including postpartum family planning. To increase awareness of integrated FP and MNCH service provision, and maintain coordination amongst the RMNCH programmes, FP and MNCH focal persons at all levels will hold periodic coordination meetings.

**SDA6. Increase the number of FP service access points for youth:** To improve access to FP services for youth and adolescents, FP and SRH trainings will be organised for youth centre staff across the country so they can effectively engage youth in conversation about family planning, impart knowledge regarding the full spectrum of FP options available to them, and refer them to youth-friendly service providers should they choose to receive an FP service. In conjunction, additional health facilities will be made more youth friendly by establishing youth corners and training service providers on youth-friendly services. To address the FP needs of university students, advocacy meetings will be organised to ensure high-quality FP service delivery by university and college clinics.

**SDA7. Increase the number of private sector providers who can provide a full spectrum of high-quality FP services:** The private sector plays an important role in providing health services in Ethiopia. Capacity building and quality improvement will also encompass the private sector, so all women have access to a full spectrum of FP choices wherever they may choose to access health services. To ensure that capacity-building trainings cover those key FP service components especially lacking in the private sector, an

assessment will be conducted first. Based on the assessment findings, the FP training programme will be adapted.

### ***Procurement and supply chain (PSC)***

#### *Strategy*

Because the central-level supply of FP commodities is generally adequate, forecasting, quantification, and procurement will continue as in recent years. However, improved data are necessary to provide more accurate forecasting. Specific activities will help strengthen the capacity of facility staff to (1) report on contraceptive commodity distribution and place orders in an accurate and timely manner; and (2) ensure that contraceptives are delivered to hospitals, health centres, and health posts to achieve commodity security in both urban and rural areas.

At the national level, the MOH, in collaboration with the PFSA and relevant stakeholders, is responsible for forecasting, quantifying, and procuring contraceptive commodities and consumables. The PFSA is responsible for procurement, storage, and distribution of contraceptives and consumables from the central warehouse all the way to the service delivery point. Support will be provided to ensure that the FP commodity supply remains secure and consistently available. Specific activities will build the capacity of the MOH, PFSA, Food, Medicine and Health Care Administration and Control Authority (FMHACA), and RHBs. Activities also will ensure that data are used to improve commodity availability; contraceptives in stock are used; and the procured contraceptives are safe, effective, and of high quality.

#### *Strategic outcomes*

**PSC1. Conduct annual quantification of contraceptive commodities and supplies.** The MOH will conduct forecasting for annual contraceptives and related commodities, as well as quantifications and the supply plan, by collaborating with relevant stakeholders and partners. Forecast accuracy will also be done on an annual basis to check and confirm that they are aligned with actual demand and FP programme performance. Stock availability and stockout rates will also be monitored annually.

**PSC2. Conduct quality assurance testing of contraceptives.** Support will be provided to the FMHACA to improve capacity in registration and conduct post-market surveillance on contraceptives, including quality assurance testing.

**PSC3. Improve the PFSA's capacity to use data generated at the facilities to ensure the timely distribution of commodities.** Trainings will be provided at the federal and regional levels for PFSA staff on data aggregation and analysis to increase their capacity to gather and utilise facility-generated data monthly to inform commodity distribution plans.

**PSC4. Ensure that capacity is sufficient at all levels for streamlined distribution of commodities from the national level to health posts.** Support will be provided for the decentralisation of the PFSA distribution system. Trainings on stock management and monitoring and evaluation (M&E) will be provided to health facility staff to improve the quality of recording and reporting of contraceptives consumption.

To advance monitoring mechanisms for stockouts, appropriate information and communications technology (ICT) will be identified and piloted in selected regions. For example, the automated short message service (SMS) stock-tracking tool used by social franchises presents a potential opportunity to scale up into the public health system. To facilitate the distribution of commodities, the PFSA and MOH will build and equip regional warehouses.

## **Monitoring and coordination (MC)**

### *Strategy*

Specific activities will aim to improve coordination amongst various government sectors and ensure that FP objectives and activities are aligned across all regions. The MOH will strengthen its coordination with other line ministries, including the Ministry of Finance and Economic Development (MOFED); MOE; Ministry of Agriculture; and Ministry of Women, Children and Youth Affairs, amongst others.

To improve coordination between the public and private sectors while ensuring oversight from the MOH, specific activities will aim to facilitate dialogue between the two sectors, clarify the roles of each, and explore opportunities to increase the number of public-private partnerships. Leveraging the resources already available in the private sector can effectively and efficiently increase access to high-quality FP services and products.

Monitoring the progress of FP activities is also critical for successful implementation of this CIP. The planned activities will and should change over time based on findings from regular monitoring. Data must be recorded, and successes and lessons learned should be documented so that programme improvements can be made and best practices scaled up. To ensure that FP-related data are readily available and accurate, responsible staff at the facility level will receive follow-up training on data entry. Throughout the health system level, health officers will engage in data aggregation and review exercises to help data analysis and use become routine. Finally, technical assistance will be provided at the regional and federal levels to ensure that technical staff and policymakers are comfortable in using data to inform decision making.

Successful monitoring of FP activities must include identifying successful strategies and ongoing bottlenecks. The activities included in the monitoring and coordination of this plan will help to identify successful approaches to reaching youth and under-served populations with FP services, document how the results were achieved, and disseminate evidence through coordinated mechanisms to ensure that the most effective approaches and best practices can be replicated countrywide.

### *Strategic Outcomes*

**MC1. Improve FP service delivery by clarifying roles and responsibilities, and streamlining national-level programme coordination:** Using the CIP as a foundation, a detailed, annual FP programme implementation plan (workplan) will be developed to define each ministry's role in supporting family planning and clarify each partner's responsibilities. Workplan implementation will be reviewed semi-annually, and an overarching CIP mid-plan assessment will be conducted in 2018.

**MC2. Improve coordination with the private sector to better leverage its resources in FP service provision:** The MOH will take the stewardship role and reach out to private sector organisations providing FP services, including social franchises. A market segmentation analysis will be conducted, with results disseminated through regional workshops. At the same time, existing guidelines for private sector provision of FP services will be reviewed and revised as necessary to ensure coordination with public sector FP service delivery, and supportive supervision of social franchises will be conducted to improve quality, coordination, and oversight.

**MC3. Ensure that regional objectives and perspectives are integrated into the national-level plan, so family planning becomes a priority on the development agenda for the regions:** An FP coordinator will be designated in each region to improve coordination amongst partners and stakeholders; this coordinator, along with other regional representatives,

will be included in the annual process to develop the national FP workplan. Other health and non-health private sector and civil society representatives will be involved in the workplan development process to ensure that it includes coordination efforts and is responsive to the needs of the community. The FP TWG or similar groups at the regional level will be instrumental in contributing to the development of annual national and regional FP workplans.

**MC4. Increase the evidence base for FP programming and improve data use for FP programmes:** Case studies on effective interventions for reaching target populations will be conducted as part of programme evaluations and disseminated to partners and stakeholders as evidence for further action through a biannual FP meeting. This meeting will also be a platform to engage policymakers in family planning.

**MC5. Ensure the availability of service delivery data through leveraging the Health Management Information System (HMIS):** Additional trainings will be conducted to ensure that health facility staff can enter HMIS data accurately and on time, and refresher trainings will be conducted based on an updated HMIS training database. At the federal level, the FP TWG will review quarterly HMIS data to identify bottlenecks and regions where data analysis needs additional support.

### ***Financing (F)***

#### *Strategy*

To address the limited financial commitment to family planning from domestic sources commensurate with need, the MOH will advocate increased funding within national and regional budgets. The ministry will cultivate FP advocates within the MOFED and Parliament by developing an advocacy strategy. This approach will ensure that the national budget includes a growing line item for FP programming that meets the increasing demand for FP services as BCC and FP access activities expand over the next five years.

Similar advocacy efforts will be conducted at the regional level to establish line items for family planning in regional government budgets. Regions that already have a line item for FP commodities will strive to increase their budgets while also advocating additional budget lines for FP programming and the purchase of supplies and consumables needed for high-quality FP service delivery. Inter-regional knowledge sharing will be encouraged so that advocacy approaches effective in one region can be replicated in others, and regional staff can build a support system for resolving similar challenges in their regions. The activities outlined here will help to achieve the sustainability of FP programmes in Ethiopia.

#### *Strategic outcomes*

**F1. Advocate increased funding for family planning from the federal government:** The MOH will develop an advocacy strategy to gain buy-in from parliamentarians to support increases in the ministry's FP line items. Evidence-based advocacy briefs will be drafted to show how increased funding from the government can improve the livelihood of Ethiopia's citizens and how investments in family planning can yield both economic and health benefits. The MOH will hold advocacy meetings with the MOFED and parliamentarians, and proactively track the national government's progress towards meeting its FP2020 commitment to increase the budget for family planning.

Parallel efforts will be made at the regional level to secure or increase FP line items. Inter-regional knowledge-sharing meetings will be held throughout the five-year period

to share successes and challenges amongst the regions, and replicate effective approaches and best practices.

## SECTION 3: COSTING

The CIP costing tool<sup>76</sup> was used to determine the cost of implementing the plan’s activities. Each activity was broken down into individual cost elements (cost items), unit costs assigned, and number of units calculated based on the activity target. The frequency and recurrence of activities over the CIP period (2015–2020) were also assigned so cost per year could be estimated. The subsections below summarise the costs of CIP activities, broken down by thematic areas.

### Costing Assumptions

Unit costs were gathered from various sources and include standards provided by the MOH, the PFSA, and implementing partners. If specific costs for items were not available (e.g., if an activity has yet to be implemented in Ethiopia), the costing data were drawn from an African regional or international source and noted as such in the costing tool. All cost elements, unit costs, quantities, and frequencies are editable in the costing tool based on changes in the plan.

Contraceptive costs were calculated from 2015 to 2020 using the 2014 Ethiopia Mini-Demographic and Health Survey (EMDHS) results for CPR amongst married women as a baseline for the 2014 method mix. Using the 2020 objective CPR of 55 percent amongst married women, the CPR for each intermediate year between 2014 and 2020 was interpolated. To achieve the 2020 objective, Ethiopia will need to increase the CPR by 2.2 percent annually. The estimated CPR inputs can be updated when the PMA2020 data are released each year to reflect a realistic commodity requirement; the objectives should also be updated if these CPR inputs are changed. The projected method mix for 2020 was calculated in line with the objectives set in the Reproductive Health Strategy (2016–2020) and corresponds with the priority activities within this plan.

Unless otherwise noted, all recurrent costs (e.g., salaries, per diem rates, fuel costs, venue hire, etc.) are based on current costs as of April 2015 and have been automatically adjusted for a base rate of inflation of 2.5 percent over time. The inflation rate can be adjusted to accommodate changing conditions. All costs have been calculated in U.S. dollars (US\$) and converted to local currency. Figure 7 shows the annual cost of contraceptive commodities for each method.

Figure 7: Contraceptive costs per couple-years of protection

Contraceptive Method	Unit Cost (includes .05% for wastage)	Couple-Years of Protection Provided/ (units per year)	Couple-Years of Protection Cost
Pills	\$0.30	(5)	\$1.50
IUDs	\$0.39	4.6	\$0.19
IUD consumables	\$0.47		
Injections	\$1.25	(4)	\$5.00
Male condoms	\$0.03	(120)	\$4.03
Female condoms	\$0.57	(120)	\$68.29

Contraceptive Method	Unit Cost (includes .05% for wastage)	Couple-Years of Protection Provided/ (units per year)	Couple-Years of Protection Cost
Female sterilisation consumables	\$0.00 \$10.45	13	\$0.80
Male sterilisation consumables	\$0.00 \$2.94	13	\$0.23
Implants Implant consumables	\$8.93 \$1.85	2.5	\$4.31
Lactation amenorrhoea	n/a	n/a	\$0.00
Emergency contraceptive pills	\$0.21	(20)	\$4.20
Traditional methods	n/a	n/a	\$0.00

## Costing Summary

The estimated total costs of the plan from 2015–2020 are US\$285 million (6.2 billion Ethiopian Birr) (see Figures 8–10).

Overall, US\$215 million, or 75 percent of the overall costs, are in commodities, including contraceptives and consumables. Another 4 percent are in DC, 12 percent in service delivery and access, 7 percent in programming for contraceptive security and supply chain management, <1 percent in financing, and 1 percent in monitoring and coordination.

Costs are spread over the duration of the plan, with commodity costs increasing over time as more women are reached. In addition to commodities, the biggest cost drivers are service delivery and access, and contraceptive security and supply chain activities, at US\$35 million and US\$21 million, respectively.

The activity cost per woman of reproductive age is US\$0.47 per year, which is significantly lower than the costs in other countries—generally in the US\$2–5 range. The lower activity costs in Ethiopia are due largely to the economies of scale generated in conducting national programmes for such a large population, and the government’s policies that aim to lower activity costs (e.g., conducting many meetings and training in house and keeping government per diem at US\$14 per day). Whereas the activity cost of the Ethiopia CIP is lower than in many other countries, the cost per user for FP commodities is US\$4.69—above the range of US\$4–4.20 seen in other countries.<sup>77</sup> This disparity is likely due to Ethiopia’s method mix, which is heavily skewed towards injectables and costs \$4.76 per woman per year for the commodities alone. As Ethiopia moves towards a more balanced method mix with increased uptake of LARCs, the commodity cost per woman of reproductive age will likely increase in the near future due to the higher one-time costs of providing long-term methods but decline over time as those methods provide multiple years of protection.

Figure 8: Summary costs, by thematic areas and total, in millions US\$

Figure 9: Costs, by category, in millions US\$\*

	2015	2016	2017	2018	2019	2020	Total

\*Column totals are not always equal to the sum of the column figures due to rounding.

Figure 10: Costs, by FP2020 commitment, by year, in millions US\$

## SECTION 4: PROJECTED METHOD MIX AND CONTRACEPTIVE NEEDS

### Assumptions

The CIP activities will lead to the attainment of a CPR of 55 percent for all married women in 2020, an mCPR of 54.4 percent amongst married women, and an mCPR of 83.2 percent amongst unmarried sexually active women.<sup>78</sup> This translates to a CPR of 35.2 amongst all women of reproductive age, which will lead to a total of 10 million women users of contraception in 2020.

The method mix for 2020 was projected for the CIP based on baseline data from the 2014 EMDHS and PMA2020, and considers various factors, including availability of infrastructure, provider capacity, activities planned for scale-up, and historical trends. The method mix projections are based on the following assumptions, which were guided by best practices and recommendations made by members of the stakeholder expert groups:

1. The CIP will be fully implemented by the MOH and its partners: it will emphasise reaching under-served populations (e.g., youth, hard-to-reach populations) and creating demand and improving access for LARCs.
2. The method mix changes will consider recommendations of the MOH and stakeholder groups to maintain the widest possible range of method choices.
3. Use of LARCs will increase once they are available at more service delivery points and demand-creation activities for them have begun, with a scale-up of training probable in project activities as indicated in the Reproductive Health Strategy.<sup>79</sup> The greatest rise in LARCs will be for implants, accompanied by an increased demand for IUDs. Moderate increases in female and male sterilisation are projected to occur as these services become more accessible.
4. The method mix quantification for the CIP differs from the projections in the annual national quantification for FP commodities because it is based on variably adjusting CPR method mixes for married and unmarried women. In addition, for the CIP, only male and female condoms were included in the method mix and costed for the amount required for FP usage alone—condoms are not included in this FP costing if women used them, along with another method, to prevent HIV and other sexually transmitted infections.
5. Emergency contraception is not included as a percentage of the method mix, as it is not promoted as a regular or consistent method of family planning. It will be procured for public and private sector use as a lifesaving commodity—a contraceptive method for use when other primary methods either are not used or fail.

Figure 11 shows the 2014 baseline method mix and the 2020 objective method mix assumptions for married women.<sup>4</sup>

**Figure 11: Baseline method mix 2014 and projected method mix 2020, married women**

Contraceptive Method	Method Mix	
	2014 Baseline Method Mix <sup>80</sup>	2020 Projections
Pills	6.2%	4.6%
IUDs	2.6%	15.0%
Injections	74.2%	41.9%
Male condoms	0.7%	0.8%
Female condoms	0.0%	0.5%
Female sterilisation	0.2%	1.5%
Male sterilisation	0.0%	0.5%
Implants	12.0%	33.0%
Other modern methods	0.7%	1.1%
Any traditional methods	3.3%	1.1%
<b>CPR, married women</b>	<b>41.8%</b>	<b>55.0%</b>

Details of the annual method mix, services/commodities, contraceptive prevalence by methods, and demographic and health impacts are shown in the figures below. Standard couple-years of protection conversion factors and standard units needed for one year of use were used for these calculations.<sup>81</sup>

---

<sup>4</sup> Impacts are calculated based on the CPR objective for married women. The actual impacts of fully implementing the CIP will be slightly higher than what is reported here, due to the resulting increase in contraception use amongst unmarried women in addition to married women.

Figure 12: Contraceptive prevalence by method, married and women in union, 2014 baseline, projected 2015–2020

**Figure 13: Contraceptive prevalence by method, unmarried sexually active women, 2014 baseline, projected 2015–2020**

<b>Total</b>	<b>6,705,055</b>	<b>7,289,340</b>	<b>7,899,567</b>	<b>8,535,149</b>	<b>9,193,987</b>	<b>9,874,714</b>

## SECTION 5: IMPACT

The ImpactNow model<sup>83</sup> was used to calculate the impacts of increasing the CPR to 55 percent by 2020. These demographic, health, and economic impacts include the following:

- Unintended pregnancies averted
- Abortions averted
- Maternal deaths averted
- Child deaths averted (due to improved birth spacing)
- Healthcare costs saved (in US\$)

These calculations estimate that FP interventions in Ethiopia will avert nearly 15 million unintended pregnancies and more than 1 million abortions, resulting in more than 30,000 maternal deaths and 391,000 child deaths averted between 2015 and 2020. Additionally, the interventions will lead to saving US\$417 million in maternal and infant healthcare costs alone during the six-year plan period.<sup>84</sup>

These impacts were calculated by estimating the current CPR for all women of reproductive age and inputting method mix assumptions for the baseline year 2014, based on 2014 EMDHS data.<sup>85</sup>

Figure 16 shows the impacts of increases in FP demand, use, and priorities for 2015–2020 in Ethiopia. The numbers are drawn from EMDHS 2014 data and projected outward based on full CIP implementation; they show how the scaled-up interventions will significantly affect outcomes in reproductive, maternal, and child health in Ethiopia, and how the improved outcomes will lead to significant cost savings for the health system.

Demographic impacts: “Unintended pregnancies averted” refers to the number of births that will not occur due to the increased use of contraception. Outcomes of these pregnancies include live births, abortions, miscarriages, and stillbirths. The number of pregnancies, including abortions, averted also affects maternal mortality, given that women sometimes die from abortion complications. As the number of abortions declines due to increased FP use and fewer unintended pregnancies, maternal deaths also will decline.<sup>86</sup>

Health impacts: As a result of full CIP implementation, significant numbers of maternal and child deaths will be averted, as well as unsafe abortions, thus contributing to a healthier population.<sup>87</sup>

Economic impacts: “Economic impacts” refers to maternal and newborn health costs averted through increased provision of family planning. Given the priority on achieving the demographic dividend in Ethiopia, these data hold particular significance.

**Figure16: Annual impacts of the CIP**

	2015	2016	2017	2018	2019	2020	Total
<b>Demographic impacts</b>							
Unintended pregnancies averted	1,963,084	2,154,811	2,355,658	2,567,691	2,790,360	3,023,853	14,855,458
Births averted <sup>5</sup>	1,431,678	1,571,504	1,717,982	1,872,618	2,035,011	2,205,011	10,834,092
<b>Health impacts</b>							
Abortions averted	186,118	204,296	223,338	243,440	264,551	286,689	1,408,432
Unsafe abortions averted	107,376	117,863	128,849	140,446	152,626	165,397	812,557
Maternal deaths averted	5,469	5,406	5,257	5,019	4,681	4,234	30,065
Child deaths averted	51,759	56,814	62,110	67,700	73,571	79,728	391,683
<b>Economic impacts</b>							
Maternal and infant healthcare costs saved (US\$, millions)	\$55.2	\$60.5	\$66.2	\$72.1	\$78.4	\$85.0	\$417.4

<sup>5</sup> Births averted are calculated as a subsection of unintended pregnancies, for which the number of births averted is equal to the number of unintended pregnancies averted, multiplied by the expected number of live births per unintended pregnancy.

## SECTION 6: INSTITUTIONAL ARRANGEMENTS FOR IMPLEMENTATION

### Performance Monitoring and Accountability

Measuring performance against set targets in the CIP is crucial to generating essential information to guide strategic investments and operational planning. Monitoring and evaluation of the CIP will rely on various systems and data sources (routine and periodic), supported and maintained by numerous stakeholders. Soon after the launch of the CIP, the MOH will develop a comprehensive performance monitoring plan and associated monitoring tools.

Service utilisation data will be collected through the HMIS and from the Track20 and PMA2020 initiatives. The MOH and working groups will routinely use the information generated to track progress in mobilising resources and achieving results against set programme targets. This mechanism will help ensure that implementation efforts conform to the plan and the results achieved align with performance targets. Also, process monitoring will allow for corrective and preventive action along the way, including fine tuning of strategies and planning and coordination.

Data will be collected for several categories and levels of indicators. A comprehensive list of output-based indicators is included in the activity matrix in **Figure 17**.

Key performance indicators will hinge on strategic priorities to assess implementation progress and be presented in a dashboard format to provide a snapshot view of the programme's status.

Biannually, the MOH will convene a joint progress review meeting to assess the progress of CIP implementation against targets and agree on priorities for the upcoming period. The RHBs also will attend these meetings to share and discuss progress in their districts. The meetings thus will serve to assess CIP outputs/outcomes as key accountability mechanisms in assessing implementation. The meetings also will involve reviewing the planning and programming process in time to make recommendations for the next annual work planning cycle or long-term strategic planning.

A formal appraisal of CIP implementation will be conducted midway through the plan period to assess progress and areas of preventive or corrective action.

<sup>82</sup> This is the estimated number of services by method that would need to be provided to reach the FP goal. These have been calculated based on the total users needed to reach the goal, continued use of long-acting and permanent methods from baseline use (from historic services or CPR), and method-specific discontinuation. The results are dependent on the method mix of services set for each year.
